When dealing with icons, particularly to the eye of an ordinary user, icons must be as small as possible. The eye is extremely sensitive to tiny details. When making icons, you always want to create the maximum visual impression with minimum effort. Pixelformer is an application that can help you reach this goal. Pixelformer Description: The original Google Windows Phone UI is already a great improvement over Windows Mobile. The design is clean, looks and feels great, and is a far superior design than previous versions of Windows Mobile. Microsoft however, does not have an official SDK to create applications for Windows Phone. All applications are derived from applications built with Windows Mobile SDK. In particular the operating system for phones like the Windows Phone 7, is also developed for Windows Mobile. In the meantime, the creator of the Windows Phone UI, David Ngo, created several unofficial SDKs and the start screen templates. Ngo also developed a tool called Microsoft Design, which creates icons for Windows Phone applications. On top of that, Ngo has shared a free template to create a lovely looking application called start_template_wp7. This template includes the basic application screen, as well as the design elements that makes Windows Phone 7 apps. Due to Ngo, creating an application for Windows Phone 7 is very easy, and it can be done with very little effort. The template is relatively small and creates a great-looking app that really shows off Windows Phone 7 UI. What if you could use this template for iPhone and iPad? Pixelformer Description: One of the problems with creating apps for Apple mobile devices is that the UI designs are based on the Mac OS. On top of that, Mac OS includes two other UI designs for a trackpad (although this design is included in OS X 10.5 or later, due to the fact that the trackpad is often connected through a USB) and a keyboard (that is an option in Windows only). The UI designs are based on a modified Dock for the Mac OS. This is a design that looks great, and it doesn't seem like any work was invested in designing it. What if you could use the Windows Phone 7 template to make apps for iOS devices? Pixelformer Description: When compared to Windows Phone 7 and the templates that allow you to create apps for Windows Phone 7, the design elements for iOS devices are a bit different. The iPhone is more like an advanced flip phone.
