As far as user friendliness and features go, there has been very little that's dramatic in this release. The upgraded Speed Booster performance improvement and Smart Previews enhancement (we do our own in-depth testing) are the two major player. Adobe Layout Manager tools give us the capability to cut complex layouts and artwork into individual pieces and organize them for display on a PowerPoint presentation, in print, or on a website. The design templates are broken into page types, fonts, color themes, logo styles, and logo sizes. When that's finished, the design process can begin and the various templates created. Permissions areas are helpful for making it easier to handle the editing of digital images. Data protection (the ability to prevent the accidental overwriting of original files) is now available to Lightroom 2 or later and Photoshop 8 or later. With this release, Lightroom 2 and Photoshop 8 users can have the best of two worlds and use either software. Lightroom's new Aviary team has it covered for seamless photo sharing. Old friends from PSD-flavored layouts are there, too, along with the robust image adjustment options. I was pleasantly surprised to discover Adobe has created an Adobe Stock catalog, too. My final thoughts are that Adobe has done well in pre-empting some of the features in Elements. It feels more like Photoshop than Elements does. Photoshop is truly on a roll, so we can expect to see more great improvements in future versions. As for Lightroom, I've already recommended this version for about a decade and I'm happy to refine that recommendation to "convert to Lightroom 5 today!"

Photoshop is a hugely popular application and it is loved by people all over the world. People are using Photoshop to create amazing digital projects all the time. But as the years passed and technology was advancing, especially the emergence of iOS and Android mobile devices, people got less time to spend on computers. So that made people seek for an alternative to the computer. I will tell you a little bit about Photoshop. Photoshop is a very popular piece of software. It is a tool for post-production and editing. The file that stores the information about the image can be in any format, but it's not unheard of that the same image is edited many times for the same effect. This makes it really important that the same data can be read with any computer without any quality drop. The artist and the photographer should have the ability of being able to see the changes on the image as they are made. That's a big advantage in using a good editing program. My wife is a software developer and she is always cleaning things up in the code. But as a programmer, she can only see the end result. For example, she can clean it up, so it will run on all devices, but our tradesmen cannot see her work. If our image is lost because of an image editor, there's nothing we can do about it. So the artistic aspect of programs like Photoshop is that the image is treated as art and it is not just a source file. I think one of the great benefits of internet technology is how much information you can collect, even for the smallest and simplest projects. A lot of people just download photos from a camera or scanner. But in 2020, it's worth it to group photos into collections in an organized way. A lot of times, people will take pictures but they just never finish editing on that image. So we can have something as simple as group them in a more detailed way.
