Changes in Photoshop CS6 are so obvious they don't even need a reference; in fact, a simple glance is enough to see most of them. One of the main changes is that a new True Type font panel has been added to create and edit different font styles and sizes, allowing for altering a font's appearance by setting different weights and styles. Internet Explorer is no longer handled by a separate browser and it now keeps a cache of your last visited web pages. You can now search for web images by size, format and matching a color. To help compare different versions of a file, you can click the little + or - signs to compare changes over different edits. You can now select a range of similar images, recreate layers or add clipping paths in Photoshop. Plus, you're able to revert to older versions of a file at any time, so you can go back to your work if something goes wrong. Photoshop CS6 has also booted up a new preview panel that's capable of crop, rotate, resize and sharpen an image in no time. Instead of opening a new window to view the previous edits, the new one allows you to see the changes thanks to a materials preview panel. But in spite of these changes, lightroom is still unbeatable. New features are being added to Photoshop even now. You can unify Adobe Camera Raw 5.0 and Lightroom 5.0 together with Photoshop essentials from Dave Kellar. You can also use the new tools including the Photoshop lens to view images, create light, color adjustments and edit images using real-time previews. You can also use the Photoshop lens as a view finder but it is not working on Mac OS.

Create a new document. On the Create a Graphic Type panel, the default resolution is 2000 pixels by 5000 pixels. If it is too large, you can decrease the resolution down to 2500 by 4000 pixels, and so on. The number of pixels in any image or graphic is represented by the resolution setting. You can change the resolution of the image by choosing Image > Image Size > Resize and the Size menu will be automatically updated to reflect your new settings. Smaller numbers will create a line art image that is prone to damage in terms of the clarity of image. So, if you are creating a photograph it is best to choose a resolution number near the mid-range of 100-200 numbers. Thanks to advances in technology, it's easy and fast to make changes to your images and make sure that the end result is perfect! You can select and adjust the individual colours in your image using the click and drag tools. Zoom in and out using the Zoom tool and the proper tools for adjusting individual colours are the eyedropper tools.The eyedropper tools are actually more than a single tool. The eyedropper tool is at the heart of a lot of new and exciting features in Photoshop (and several other programs! - sneeze--->). After you have highlighted the area, the "Paint Bucket tool" is now ready to use. You can choose a limited palette of colours that you want to use. If you choose a palette of colours that the hue of the image does not match, the new colour will blend into the original colour. So, for instance, if you paint a group of reds in your image, a light magenta colour will blend in. If you paint all yellow, a grey shade will blemish the entire image. e3d0a04c9c
