Adobe stayed true to itself in making this release, and it's much more than a simple update. Windows includes a new Devices panel that lets you manage printers, scanners, and Webcams from a single interface that is friendly toward hardware—an improvement over other operating systems that, instead, group these kinds of hardware into their own separate control panels. That's where the major enhancements come into play. The Auto Profiles technology, which was introduced with version CS6 but gained a lot more power with version CS9, now lets you take a series of images as you change lighting or composition and manufacture an action that can be applied to the same images easily. I like the idea of having separate document windows for each image. The 'new' feature always confused me, because it means you always have as many floating windows in the middle of the workspace. It's not at all obvious how to use it, and it's a pain when you have sizes to match. The new clipping mask is a big deal for people who are used to using the 'Magic Wand'—the tool for selecting an object in your image. Those with greener pastures might want to leave that one to show them what they've been missing. Clipping masks make all kinds of modifications to masks naturally, and they also let you take complete control over what gets cut out of a cropped image. Autoencoding. This one's hot and made a big splash at Photoshop World. The new technology, which was demonstrated to me again and again at the show, saves time by automatically converting Photoshop documents to JPEGs, TIFs, or PNGs with the same quality, size, and physical and file characteristics as the originals.

When you do, you will see a few files, 2D and 3D, selected on the left title bar. Pick "2D" and the browser will load another canvas style window. Select the 2D canvas and make your selections. Pick the 3D option. The window will load and you will be presented with a 2D and 3D workspace in the preview window. On the left side of the preview window is a title bar with the 2D and 3D buttons. With Photoshop Elements, you can choose the orientation of your photo, make a selection, zoom it in, pan around, crop, and alter colors and curves (and eventually brushes and masks). You can even apply a basic level of advanced correction, such as an Eye Dropper, with the selection tool. You can also adjust the brightness, contrast, and saturation of a photo. But you lose some of these features when you go to the web. The Photoshop on the web editor only offers basic cropping and resizing, no adjustment options, and a basic toning filter. In Elements, you can make selections, drag objects around the canvas like other 2D editing tools, add text, adjust the positioning of objects, apply gradients, add basic text effects, use the Clipping Mask feature, and add simple paths. You can rotate, resize, flip, crop, and adjust the level of noise reduction. Adobe has added Alpha channels, which are similar to layers in the more complete version of Photoshop. One of the most impressive editing features is Content-Aware (or Crop-Aware) Fill. An easy way to fill a image and eliminate a noise-like defect in an image is to have Photoshop Elements crop the defective area and use Photoshop's (or your own) selection tool to fill in the area. If you have several images where you need this, you will be happy that Photoshop Elements offers this feature. Visit the Photoshop website to learn more.
